ASTRO 010 - Introduction to Astronomy 3.00 Units

Grading: L | **Advisory Level** — **Read:** 3 | **Write:** 3 | **Math:** 3

Transfer Status: CSU/UC | **Degree Applicable:** AA/AS

This is an introductory science course for non-science majors covering topics of modern Astronomy. It highlights pivotal aspects in the history of Astronomy such as its distinction and further separation from Astrology. It lists the physical processes governing the origins of a star system and indicates the causes of the apparent motion of sky objects and cyclic sky events. The sources of periodical astronomical events such as phases of the moon, solar and lunar eclipses, meteor showers, and seasons are identified and related via the fundamental laws of physics. The astronomical tools of photometry and spectroscopy are introduced for their indispensable role in analysis towards the detection of planets around other stars, the investigation of dark matter and dark energy, and the ongoing search for extraterrestrial life. Additional topics include the

origins of galaxies, large scale structure, and a full description of the Big Bang theory.

Analyses of DC and AC circuits are performed using Kirchhoff's voltage and current laws. Emphasis is given to resistive, capacitive, inductive, and amplifier circuits powered by independent and dependent sources. The transient nature of first-order and second-order circuits containing capacitors and inductors is studied. Thevenin's and Norton's theorems are applied to DC and AC circuits and properties of these circuits for maximum power transfer are determined. The concept of impedance is used to analyze AC circuits in the frequency domain as well as to perform power analysis. An introduction to the construction of electrical circuits, basic use of electrical test and measurement instruments including multimeters, oscilloscopes, power supplies, and function generators are given. Interpretation of measured and simulated data based on principles of circuit analysis for DC, transient, and sinusoidal steady-state (AC) conditions is discussed. Elementary circuit design incorporating operational amplifiers and practical considerations such as component value tolerance and non-ideal aspects of laboratory instruments is emphasized. Introduction to simulation software such as PSpice and MultiSim is given.
